Preface

Numbering scheme
The numbering scheme for modules is as follows:

IMAPP-[semester]-[course number],

where [semester] is the semester in which the module is taught and [course-number] is a continuous number.

Work load
According to the European Credit Transfer and Accumulation System (ECTS), the work load of one ECTS credit corresponds to 25 to 30 hours of work. Given the different lengths of the semesters in France, Germany and Italy as well as the different type and depth of the modules, the individual work load can vary. The work load quoted in the description of the modules below is calculated assuming 25 hours for consistency and represents the typical work load associated with the modules.

Mode of delivery
All courses are planned to be delivered face-to-face, but the mode of delivery can be changed in agreement with the students or external constraints. While distance learning is possible for most lectures and seminars, it is difficult to maintain for laboratory courses.

Examinations
Most modules are completed by an examination. If the type of examination is not fixed in the module description it has to be specified by the examiner no later than two weeks after the start of the course. Details about the examinations, e.g. the length and the announcement procedure, are detailed in Section 9 if the Examination Regulation.

Teaching methods
The teaching methods used depend on the type of course:

- “Lecture” for lecture-type courses and seminars given by invited speakers
- “Problem-based learning” for exercise sessions, e.g. in theoretical physics
- “Seminar” for presentations prepared by students
- “Directed discussion” for an in-class discussion of the presented material organized by the teacher
- “Laboratory method” for lab experiments conducted by the students and under supervision
- “Research” for the Master thesis and internships

Teachers can deviate from the teaching methods indicated given personal preferences.
Program learning outcomes

Students will acquire basic knowledge in the fundamentals of particle physics, in programming using modern computer languages, in instrumentation and detector physics as well as in statistics and machine learning. They will also obtain advanced knowledge in current problems in experimental and theoretical particle physics including state-of-the-art methodology and technology as well as the historical development. The students will learn to analyse and solve concrete and abstract problems. They will acquire skills important for scientific work and for scientifically oriented professional activities including the application of mathematical and technical methods to problems in particle physics, the critical discussion of scientific topics and the conduction of research projects in which they investigate a scientific problem. The students will be able to conduct independent research in particle physics or related fields on an international level. Furthermore, the students will obtain language and presentation skills (English, possibly French German and/or Italian) and practice geographical mobility.
Modules of the first semester

All modules of the first semester are offered by UCA. Compulsory modules sum up to 27 ECTS credits and students can choose from elective courses to obtain further credits.

3 Content

The course gives an introduction to the quantum field theory framework, starting from the classical field theory (Lagrangian, Hamiltonian and Nöther’s theorem), introducing the free quantum field theory (from classical theory to quantum field theory, Fock spaces, free scalar field, free fermion, Dirac field), and covering concepts on interacting fields and Feynman diagrams (S matrix, Klein Gordon scalar field, Green functions, Wick theorem, Feynman diagrams, Dirac fields, generalities to derive the Feynman rules). Cross-sections and decay widths (normalizing the states; decay rates; cross-sections; application to 2-body final states) are discussed. The second part of the course gauge theories with QED as a living illustration, with an introduction to Local gauge invariance, abelian Higgs mechanism, Yang-Mills theory and renormalization. Finally QCD foundation will be introduced, namely the quark model, SU(2) and SU(3) groups, the color charge, QCD Lagrangian, Feynman rules, QCD colour factor, the running of the coupling constant alpha_s, QCD in different regimes: confinement, and asymptotic freedom, quark and gluon plasma, elastic scattering electron-proton.

4 Learning outcome

The students will acquire basic knowledge of quantum field theory, on how quantum mechanics and special relativity are combined to produce realistic theories of particle creation and annihilation. They will obtain skills in calculation techniques to at least tree-level Feynman diagrams for quantum electrodynamics; acquisition of foundation for more advanced studies in Standard Model theory.

5 Teaching methods

Lecture (80%) and problem-based teaching (20%)

6 Examination

Graded module

7 Coursework and examination requirements

Coursework: To be defined by the lecturer.
Examination: Oral or written examination.

8 Prerequisites

Quantum mechanics, mathematics

3 Content
The course covers basic concepts of the Standard Model of Particle Physics. The introduction part of the course introduces the Dirac equation (solutions and interpretation), particle decay width and cross-sections, interaction by particle exchange, matrix element, example of Feynman rules for QED, interaction strength (EM, strong and weak interactions), higher order effects (Lamb’s shift, anomalous magnetic moment, and a brief introduction to renormalization in QED). An overview about continuous and discrete symmetries in Physics is given with particle physics and solid state physics illustrations. Finally, the course covers the Standard Model of Particle Physics. Electroweak unification and the spontaneous electroweak symmetry breaking (EWSB) by the Brout-Englert-Higgs mechanism are discussed. Following EWSB, the mass mixing matrices are introduced and further discussed in subsequent lectures featuring lepton and quark flavour phenomenology and discussing recent experimental results.

4 Learning outcome
The students will acquire basic knowledge about the Standard Model of particle physics and of the experimental processes, methods and historical measurements. They will be able to judge the consistency of physical models and to apply mathematical methods to the problems at hand.

5 Teaching methods
Lecture (80%) and problem-based teaching (20%)

6 Examination
Graded module

7 Coursework and examination requirements
Coursework: To be defined by the lecturer.
Examination: Oral or written examination.

2 **Language**: English

3 **Content**

The programming part of the lecture covers a practical introduction (object, collections, functions, loops and few pythonics syntax, basic file manipulation), Numpy introduction (numpy arrays vs python list, vectorization, (fancy) indexing, broadcasting). Data analysis python ecosystem (overview, data representation: matplotlib, import/manipulate data: pandas, mathematics, physics and engineering: scipy), and basics of image processing (loading/plotting, colors, grey scale, image filters: kernel, blocks, sliding windows). The second part of the lecture is about manipulation of data, so-called data mining and includes data preprocessing (data visualization, data cleaning, data space transformation), clustering (hierarchical clustering, partitional clustering), association rules, feature reduction (feature extraction, feature reduction) and hands-on sessions.

4 **Learning outcome**

The students will acquire extended knowledge about the python language and computing tools to deal with and manipulate mass data. The programming course brings to the students the pre-requisites for advanced applications in the machine learning module. The student will be able to write programs to solve simple problems using the methodologies treated in the lectures.

5 **Examination**

Graded module

6 **Teaching methods**

Lecture (50%) and problem-based teaching (50%)

7 **Coursework and examination requirements**

Coursework: To be defined by the lecturer. Examination: Oral or written examination.

3 Content

This course introduces basics of statistics and modern methodologies and algorithms to solve complex problems in data analysis with Artificial intelligence and machine learning (ML). The first part of the lecture covers samples (description and definition of basic quantities: size, dimension, iid, empirical quantities: sample mean, sample variance, quantiles, propagation of uncertainties, binned samples: definition, law of probability), statistical models (definition, ingredients of statistical models: observables, parameters of interest, nuisance parameters, dependent and independent variables, likelihood function and extended likelihood function, composite statistical models, introduction to the treatment of nuisance parameters), inference (introduction to the inference problem, introduction to the frequentist and the Bayesian approaches), and parameter estimation (definition of estimator, properties of estimators: consistency, bias, efficiency, methods for estimating parameters: maximum likelihood, least squares, Bayesian inference). The second part covers basic concepts of machine learning (introduction to ML, deep learning and representation learning, training and testing, cross validation, bias-variance decomposition, curse of dimensionality), regression with linear models (simple example: polynomial curve fitting, linear basis function models, regularization, likelihood and regression), and classification (linear models for classification, perceptron algorithm, linear discriminant analysis, logistic regression, Artificial Neural Networks, popular NN algorithms).

4 Learning outcome

The students will acquire extended knowledge about statistics, from the mathematical foundations to their applications in particle physics and beyond. A second lecture provides the students with skills about machine learning algorithms.

5 Examination

Graded module

6 Teaching methods

Lecture (70%) and problem-based teaching (30%)

7 Coursework and examination requirements

Coursework: To be defined by the lecturer.
Examination: Oral or written examination.

2 **Language:** English

3 **Content**

This course covers current topics on experimental and theoretical particle physics.

4 **Learning outcome**

The students will gain knowledge in current topics of experimental and theoretical physics that goes beyond the material covered in the introductory modules. Students will improve their skills critical thinking and discussions. Students will also acquire the skill of finding and studying related literature and other learning material independently in preparation for the seminar.

5 **Teaching methods**

Lecture (100%)

3 Content
Various models in particle physics and their theoretical background including the flavor problem and observables, rare decays, effective theories, dark matter, the Higgs sector, quantum gravity and asymptotic safety, model building and phenomenology as well as recent experimental results.

4 Learning outcome
The students will acquire knowledge in different models uses in particle physics and the phenomenology connected to those. They will critically judge the validity of the models based on measurements and experimental tests. The students will improve their presentational skills and learn how to discuss critically.

5 Teaching methods
No. 1: either lecture (100%) or seminar (50%) and directed discussion (50%). No. 2: seminar (50%) and directed discussion (50%)

Basic experimental methods in accelerator-based particle physics; interpretation of the data; methods of conducting data analysis including data preparation, physics objects, statistical modelling and the treatment of systematic uncertainties; phenomenology of different processes and recent experimental results including searches for new phenomena, precision measurements as well as an overview of current and future experiments.

4 **Learning outcome**

The students will obtain knowledge on the basics of experimental particle physics and the methods used. They will acquire advanced knowledge about the statistical analysis of collider data and recent experimental results. The students will apply their knowledge on concrete problems encountered in such analyses. They will be able to understand all steps necessary for interpreting large data sets from collider experiments.

5 **Teaching methods**

Lecture (80%) and problem-based teaching (20%)

2. **Language:** English

3. **Content**

No. 1: experimental techniques in particle physics including detector physics (semiconductor and scintillating fiber detectors), data analysis (CP violation and top-quark physics, reconstruction of particles) and advanced statistical methods (machine learning).

No. 2: Different types of detectors used in particle and/or medical physics, e.g. semiconductor and scintillation detectors, X-ray detection systems. Detector systems and components composed of different types, e.g. calorimeters, modern particle physics experiments, PET, CT, etc.

4. **Learning outcome**

The students will obtain basic knowledge about particle and medical physics detectors, the technology used and the further processing of such data. They will understand how complex detector systems work and will apply their knowledge to laboratory experiments. The students will understand the relationship between the primary interactions of the particles to be detected with the entire material traversed and the different design methodologies. This leads to an understanding of the respective advantages and disadvantages of the construction types for various detector components. Furthermore, the student will acquire skills for critical reading of the literature and presentational skills.

### Language: English

#### Content

Basic concepts of analog and digital electronics as well as their applications. The course comprises five experiments in which the functions and characteristics of diodes, transistors and amplifiers are studied as well as the basics of digital networks.

#### Learning outcome

The students will acquire knowledge about the basic concepts of analog and digital electronics. They will understand the properties and characteristics of individual components and build simple circuits and networks. The student will gain expertise in working with real circuits and standard measurement setups. The laboratory experience will allow the student to develop social skills working in teams.

Language: English

Content
No. 1: Discussion of results and discoveries in the field of particle physics that have been proven wrong. Connection to current research and modern methods of research.
No. 2: Modern tools used in particle physics, e.g. machine learning, or in-depth studies of recent discoveries and measurements using modern methods.

Learning outcome
The students deepen their knowledge in the field of the particle physics by self-study. They also train skills in the area of scientific research and presentation techniques. In addition to these classic skills, the seminar helps students become aware of the rules of good scientific practice and reflect on potential problems. They will acquire advanced knowledge on modern methods used in particle physics.

Teaching methods
Both: seminar (50%) and directed discussion (50%)

Examination
Graded module

Coursework and examination requirements
Coursework: Active participation in the two seminars
Examination: A presentation in at least one of the seminars

Prerequisites
Basic knowledge of particle physics

Recommended literature
Scientific literature and specific publications are distributed during the class

Module type
Elective module

3 Content
No. 1: The lecture covers basic principles of instrumentation, electronics and sensor technology. The characterization of instruments, aspects of data acquisition as well as measurement procedures is discussed. Furthermore, applications of instrumentation in specific fields of research, e.g. particle physics, condensed matter physics or medical physics, are presented. Current developments in instrumentation are briefly reported on.
No. 2: The seminar focuses on the historical development of instrumentation in specific fields of research. Concrete examples for modern instrumentation systems, e.g. in spectroscopy, particle physics or medical imaging, are discussed.

4 Learning outcome
The students acquire basic knowledge of modern instrumentation. They are able to name and explain different sensor and detection principles, and understand the composition of common instrumentation systems. Furthermore, the students acquire skills for the critical reading of the literature and improve their presentation techniques.

2. **Language:** English

3. **Content**

4. **Learning outcome**

The student will get acquainted with the properties and features of our current description of the fundamental particles and their interactions. Motivated by its theoretical limitations as well as by the current experimental observations, the students will then be exposed to the most common avenues towards extending the Standard Model and searching for new physics in high-energy experiments.

5. **Teaching methods**

Lecture (100%)

6. **Examination**

Language: English

Content

The course covers aspects of flavor physics in the hadronic and the leptonic sector. The first part of the lecture focuses on the weak hadronic interaction and CP violation: weak charged current interaction and its classification, the Fermi constant, Cabibbo mixing, the Glashow-Iliopoulos-Maiani mechanism, quark mixing and the Cabibbo-Kobayashi-Maskawa (CKM) matrix, weak neutral currents, quantum mechanical oscillations in the K, D, and B meson systems and experimental results, CP violation in the K, D, and B meson decays and experimental results, the unitarity triangle of the CKM matrix and the current experimental knowledge. Rare K, D, and B decays and experimental results. The indirect search for new physics with flavour physics experiments. The second part focuses on flavour physics in the leptonic sector: charged and neutral leptons in the Standard Model, physics of massive neutrinos, the mechanism of neutrino mass generation, neutrino cross sections, experimental searches in the framework of seesaw mechanisms (colliders, beam dumps), neutrinoless double beta decay, flavour mixing and CP violation in the neutral sector, short/medium/long baselines (accelerators and reactors), connection with cosmology, leptogenesis, the dark sector, flavour violation in the charged sector, electron and muon magnetic dipole moments.

Learning outcome

At the end of the course the student will become familiar with the basic concepts of heavy flavor and neutrino physics. He/she will get acquainted with the rich CKM and PMNS phenomenology, from CP violation in the hadronic and leptonic sectors up to search for New Physics through the measurements of rare decays and the quest for Majorana fermions at low energy and at colliders. The student will also be able to conceive an experimental apparatus useful for these searches and distinguish between the main experimental techniques used to reach this goal.

about the emerging “Fog” and “Edge” computing paradigms and how they are linked to Cloud infrastructures will conclude the course. The third part is on Advanced C++ programming for computer science and cover the use of modern C++ to efficiently exploit the memory hierarchy and the heterogeneous nature of current computer architectures. Further application of C++ programming techniques including subjects such as file access, abstract data structures, class inheritance, and other advanced techniques. The following C++ programming topics are covered: classes, objects, function and operator overloading, inheritance and dynamic polymorphism, templates, exception handling, standard template library, data structures, complex input/output standard and file handling techniques, program documentation, bit manipulation and other advanced C++ techniques.

4 **Learning outcome**
At the end of the course the student will acquire a knowledge in advanced statistics, programming languages and tools for data processing. Furthermore, the student will learn the fundamental aspect of a data centre dedicated to scientific computation.

3 **Content**

This course aims to prepare the students for the thesis work. Researchers and professors from the three universities and the associated partners are invited to give a seminar of about two hours to present their research activities and possible opportunities for the internship in preparation for the final exam. It is planned to have a maximum of 15 seminars. Students will be invited to deepen their knowledge by studying extra materials provided during the lectures.

4 **Learning outcome**

At the end of the course, the student will know all the research opportunities offered for the thesis as well as the basic knowledge necessary to conduct research work and write the final document.

Modules of the fourth semester

The modules of the fourth semester are offered by TUDO, but can be worked on at either of the universities or partner institutions. The only compulsory module is the final examination worth 12 ECTS credits that will take place at TUDO. Students will need to choose from one of the elective modules which are associated with research conducted at the university, a research laboratory or a company, and which each correspond to 18 credits. The result of all three modules is a Master thesis.

**Examination**

Graded module

**Coursework and examination requirements**

Coursework: None. Examination: Graded Master thesis.

**Prerequisites**

See examination regulation

**Recommended literature**

Specialized literature will be provided by the supervisor

**Module type**

Elective module

**Responsible**

Prof. Dr. Kevin Kröninger

**Organization**

TU Dortmund University, Department of Physics
## Internship abroad in preparation for the final examination (IMAPP-04-05)

### Degree program: Advanced Methods in Particle Physics

### Language: English

### Content

In preparation for the final examination, the student performs activities in the field of scientific research or technological advances, to be carried out at study centers, public and private agencies or companies, abroad.

### Learning outcome

The student carries out a specific work, under the supervision of an external tutor, aimed at refining his/her learning skills and professional formation.

### Teaching methods

Research

### Examination

Graded module

### Coursework and examination requirements

Coursework: None. Examination: Graded Master thesis.

### Prerequisites

See examination regulation

### Recommended literature

Specialized literature will be provided by the supervisor

### Module type

Elective module

### Responsible

Prof. Dr. Kevin Kröninger

### Organization
